

Greenland lost record 600 billion tons of ice in 2019

Washington, March 20 (RHC)-- In climate news, newly released data from NASA shows Greenland lost a record 600 billion tons of ice during an exceptionally warm summer in 2019, surpassing the previous record melt set in 2012.

Greenland's ice sheets are now losing ice six times faster than in the 1990s. The melt from Greenland over the past year alone was enough to raise global sea levels by more than two millimeters.

The past winter, which officially ended this week, was the warmest on record for Europe by far, with average temperatures 1.4 degrees Celsius — or 2.5 degrees Fahrenheit — above the previous high set in 2016.
