

USFDA expands list of dangerous hand sanitizers to 100 products

Washington, August 13 (RHC)-- The U.S. Food and Drug Administration has expanded its list of dangerous hand sanitizers to over 100 different products. The FDA warns some hand sanitizers contain methanol, which can be toxic when applied topically, and deadly if ingested.

The FDA's list also includes sanitizers that contain less than 60% alcohol — the amount needed to be effective.
