

Ebola Death Toll in West Africa Hits 3,000

Geneva, September 27 (RHC)-- The World Health Organization (WHO) has announced that the death toll from the Ebola epidemic in West Africa has now risen to over 3,000. The WHO said on Friday that at least 3,091 out of 6,574 probable, suspected and confirmed cases died according to data received up to September 23rd.

The data provided by the UN health agency shows that Liberia has recorded 1,830 deaths. It is the most affected country, with around three times as many fatalities as any other nation in West Africa. The outbreak, which began in Guinea, has ravaged neighboring Liberia and Sierra Leone.

WHO officials say the world's worst Ebola epidemic in history may kill tens of thousands of people. Nigeria and Senegal have also confirmed cases of Ebola, but no new cases or deaths have been reported in the two countries over the past few weeks.

Ebola is a form of hemorrhagic fever whose symptoms are diarrhea, vomiting and bleeding. The virus spreads through direct contact with infected blood, feces or sweat. It can also be spread through sexual contact or the unprotected handling of contaminated corpses.

It remains one of the world's most virulent diseases, which kills up to 90 percent of those who fall sick.
