

U.S. recorded 18 new cases of measles last week

Atlanta, July 3 (RHC)-- The United States recorded 18 new measles cases last week, taking the total for the year to 1,095 in the worst outbreak since 1992, federal health officials confirmed.

The U.S. Centers for Disease Control and Prevention said it has recorded cases of the highly contagious and sometimes deadly disease in 28 states as of June 27, the majority of them in New York City and nearby Rockland County.

The running tally includes both active cases and those that have since resolved. No death have been reported so far. Health experts say the virus has spread among school-age children whose parents declined to give them the measles-mumps-rubella vaccine, which confers immunity to the disease. A vocal fringe of U.S. parents cite concerns that the vaccine may cause autism, despite scientific studies that have debunked such claims.

Measles was declared eliminated in the United States in 2000, meaning there was no continuous transmission of the disease for a year. Still, cases of the virus occur and spread via travelers coming from countries where measles is common.

CDC officials have warned that the country risks losing its measles elimination status if the ongoing outbreak, which began in October 2018 in New York, continues until October 2019.
