

Living Planet report warns of devastating drop in wildlife populations

Image not found or type unknown

A new report in the U.S. warns that some wild animal populations are declining on a “devastating” scale. The 2022 Living Planet Index finds populations of amphibians, birds, fish, mammals and reptiles that were tracked for the study have declined by an average of 69% since 1970.

New York, October 15 (RHC)-- A new report in the U.S. warns that some wild animal populations are declining on a “devastating” scale. The 2022 Living Planet Index finds populations of amphibians, birds,

fish, mammals and reptiles that were tracked for the study have declined by an average of 69% since 1970.

The report's authors note that populations of many species have increased over that time even as the biodiversity of animal species continued to plunge rapidly, due to the combined effects of habitat loss, overfishing, pollution and the climate crisis.
