

Spain Could Face 50 Degree Heatwave by 2050

MADRID, April 8 (Xinhua) -- Spain could face heat waves with temperatures of up to 50 degrees Celsius by the year 2050, according to a report on the effects of climate change published on Tuesday.

The document, "1950-2050: The Impact of Climate Change in Spain and Europe: perception and impact," was drawn up for the environmentalist party *Equo* by Spanish climatologist, Jonathan Gomez Cantero.

The report describes climate change as "one of the worst environmental disasters in human history" and predicts a future in which Spain suffers from extreme heat in summer with "heatwaves regularly reaching 50 degrees Celsius."
