

World's Top Auto Company Recalls More than Three Million Faulty Vehicles

Tokyo, July 1 (RHC)-- Japanese auto giant Toyota Motor Corporation has recalled more than three million vehicles globally due to a couple of defective parts. Toyota said Wednesday that 3.37 million cars have been recalled over defects involving airbags and emissions control units.

The most affected cars include Toyota Prius hybrid and luxury Lexus, with the vehicles mostly sold in Japan, North America and Europe. Nearly half of the cars, made between 2008 and 2012, are said to have faulty passenger and driver airbags. Toyota said that the problem could see the safety device partially deploy and create the risk of injury.

The other defect is tied to problems with a fuel emission control unit that could lead to cracks developing in the unit, the Japanese company added. No injuries have been reported in relation to the defects as of yet.

Back in February, Toyota had recalled nearly three million cars due to the possibility that their rear seatbelt could come apart in a crash and cause injuries. The recall included 1.3 million vehicles in the U.S. and Canada, as well as 625,000 vehicles in Europe, 434,000 vehicles in China, 177,000 in Japan

and 307,000 in other regions.

Toyota's biggest recall occurred in 2009 and 2010 when it told clients to return as many as nine million vehicles over a suspected accelerator failure.
